AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

- 1. (original) A method of manufacturing a ceramic device comprising: transporting ceramic tape in a green state into the proximity of a first forming element; fixing a first end of said tape with respect to said first forming element; moving said tape and first forming element relatively to each other in a motion including simultaneously rotational and translational movements, thus winding said tape around said first forming element; removing said fixing of a first end thereby allowing separation of said tape and first forming element to generate a helically wound pre-formed tape; fixing at least one end of said pre-formed tape with respect to a second forming element; and moving said pre-formed tape and second forming element relatively to each other in a motion including at least a rotational movement, thus winding said pre-formed tape around said second forming element.
- 2. (original) The method of claim 1, further comprising, during the step of moving said tape and first forming element relatively to each other, continuously pressing said tape onto said first forming element at a zone where said tape first contacts said first forming element.
- 3. (original) The method of claim 2, further comprising, during the step of moving said tape and first forming element relatively to each other, exerting a force on the edge of

U.S. National Phase of PCT/GB2004/000485

the tape at a zone where said tape first contacts the first forming element to prevent slippage of said tape relative to said first forming element.

- 4. (currently amended) The method of any one of the preceding claims claim 1, further comprising, between the step of moving said tape and first forming element relatively to each other and the step of removing said fixing of a first end, closing a second clamping element around the first end of the tape.
- 5. (currently amended) The method of any one of the preceding claims claim 1, wherein the step of separating said tape and first forming element comprises moving the first forming element relatively to an edge holding back the pre-formed tape.
- 6. (currently amended) The method of any one of the preceding claims claim 1, wherein, during the step of moving said pre-formed tape and second forming element relatively to each other, the pre-formed tape is held at both ends using clamping elements, one of said clamping elements fixing one end of said pre-formed tape with respect to the second forming element, the other clamping element performing a relative rotational movement around said second forming element.
- 7. (currently amended) The method of any one of the preceding claims claim 1, further comprising the steps of removing the fixing with respect to the second forming element

U.S. National Phase of PCT/GB2004/000485

and transferring the wound pre-formed tape onto a support structure; and placing said support structure into environment for drying.

- 8. (currently amended) The method of any one of the preceding claims claim 1, wherein the tape is handled by pneumatically operated devices.
- 9. (currently amended) The method of any one of the preceding claims claim 1, wherein the step of moving said tape and first forming element relatively to each other comprises rotating the first forming element and translating the unwound portion of the tape towards the first forming element.
- 10. (original) The method of claim 9, wherein the step of moving said tape and first forming element relatively to each other further comprises translating the first forming element along an axis about which the tape is wound.
- 11. (currently amended) The method of any one of the preceding claims claim 1, wherein, in the step of moving said tape and first forming element relatively to each other, the tape is wound helically around the first forming element.
- 12. (currently amended) The method of any one of the preceding claims claim 1, wherein the first forming element is cylindrical.

TOPLISS et al.
U.S. National Phase of PCT/GB2004/000485

13. (currently amended) The method of any one of the preceding claims claim 1, wherein the tape comprises layers of electro-active material.

14. (original) An apparatus for manufacturing a ceramic device from tape in a green state, the apparatus comprising a first forming element; a first clamping system for fixing a first end of said tape with respect to said first forming element; a first mechanism for moving said tape and first forming element relatively to each other in a motion including simultaneously rotational and translational movements, thus winding said tape around said first forming element to form a preformed tape; a second forming element; a second clamping system for fixing at least one end of said pre-formed tape with respect to said second forming element; and a second mechanism for moving said pre-formed tape and second forming element relatively to each other in a motion including at least a rotational movement, thus winding said pre-formed tape around said second forming element.

15. (original) The apparatus of claim 14, wherein the first clamping system includes a spring- loaded surface that in operation continuously presses the tape onto said first forming element at a zone where said tape first contacts said first forming element.

16. (original) The apparatus of claim 15, wherein the spring-loaded surface is combined with a force-transmitting member adapted to contact the edge of the tape at a zone

U.S. National Phase of PCT/GB2004/000485

where said tape first contacts the first forming element to prevent slippage of said tape relative to said first forming element.

- 17. (currently amended) The apparatus of any one of claims 14 to 16 claim 14, further comprising a stripping edge making contact to the first forming element to separate said first forming element and the pre-formed tape.
- 18. (currently amended) The apparatus of any one of claims 14 to 17 claim 14, wherein the second clamping system includes a first clamping element for fixing a first end of the tape to the second forming element and a second clamping element for fixing the other end of the tape, the second mechanism being arranged to relatively rotate the second clamping element around said second forming element.
- 19. (original) The apparatus of claim 18, further comprising one or more saggers having recesses adapted to support the formed tape during drying.
- 20. (currently amended) The apparatus of any one of claims 14 to 19 claim 14, wherein the clamping devices are pneumatically operated.
- 21. (currently amended) The apparatus of any one of claims 14 to 20 claim 14, wherein the first forming element is a cylindrical rod.

U.S. National Phase of PCT/GB2004/000485

- 22. (currently amended) The apparatus of any one of claims 14 to 21 claim 14, wherein the first mechanism comprises a rotary drive arranged to rotate the first forming member and a conveyor system arranged to translate the tape towards the first forming member.
- 23. (original) The apparatus of claim 22, wherein the first mechanism further comprises a linear drive arranged to translate the first forming member along an axis about which the tape is wound.
- 24. (currently amended) A ceramic structure made using methods or apparatus in accordance with any of preceding claims claim 1.
- 25. (original) The ceramic structure of claim 24 being an electro-active ceramic structure.
